Six operational mechanics outlined referring to an app focused on detention retrieval and broker flexibility must solve two core industry friction points: **proving detention instantly with bulletproof data** and **reducing the administrative tax on brokers so they actually approve the claim**.

The most beneficial features that would elevate the app from a simple workflow tool into an indispensable piece of freight technology.

1. Dynamic "Broker Rules Engine" (Flexibility & Compliance)

Different brokers have radically different detention requirements (e.g., TQL requires 30-minute pre-warnings, C.H. Robinson requires specific portal submissions, and others demand signed BOL timestamps).

- **Custom Broker Profiles:** A backend directory (crowdsourced or preset) that auto-populates a broker's exact detention policy the moment their MC number or name is selected.
- **Compliance Checklist:** Before sending a claim, the app checks the load against that broker's specific rules (e.g., *"Warning: TQL requires the driver to sign in on paper at the receiver. Did you attach the sign-in sheet?"*).

2. In-App BOL Timestamp & OCR Scanner

Brokers often reject digital ELD data if the paper Bill of Lading (BOL) doesn't have handwritten or stamped times matching the ELD.

- **Auto-Extracting OCR:** When the driver snaps a picture of the signed BOL on their phone, optical character recognition (OCR) automatically extracts:
  - In-Time / Out-Time stamps
  - Driver and receiver signatures
  - Lumper fee amounts or attached receipts
- **Discrepancy Alert:** If the ELD says the driver departed at 2:00 PM but the scanned BOL says 1:30 PM, the app flags the 30-minute mismatch *before* the claim is submitted to prevent instant rejection by broker accounting.

3. Smart Geofence Auto-Check-In / Check-Out

Relying on drivers to manually press "Arrived" or "Departed" in an app creates human error that brokers love to exploit to void detention.

- **Automated Geofencing:** Integrates with Motive/Samsara API to draw a 0.5-mile geofence around the facility address on the Rate Con.
- **Zero-Touch Timestamps:** The app records exact GPS entry, dock placement, and exit times automatically. It tags these with a cryptographic or immutable time/location stamp directly on the generated proof packet.

4. Interactive "Broker One-Click Approval Link"

Emails with raw PDFs often get lost in broker inbox black holes, leading to back-and-forth emails or missed claim deadlines.

- **No-Log-In Web Portal:** Instead of just sending a PDF attachment, the email sent to the broker includes a secure link to a clean, mobile-friendly landing page.
- **One-Click Actions for the Broker:** On this page, the broker rep can view the interactive

timeline (ELD map + BOL scan) and click:

- **[Approve & Issue Revised Rate Con]** — Allows them to drag-and-drop or upload their Revised Rate Con directly into your system.
- **[Dispute Claim]** — Forces them to select a specific reason (e.g., *"Driver arrived late"*, *"Facilities state load was ready"*) so the dispatcher can address it immediately rather than waiting 3 weeks for an unpaid invoice deduction.

5. Automated "Detention Exposure" Timer for Dispatchers

Dispatchers managing 10 to 30 trucks at once cannot manually keep track of which trucks are nearing free-time limits across different time zones.

- **Live Dock-Sit Dashboard:** A centralized visual grid showing all active loads currently at a facility dock.
  - **Green:** Within free time (0–90 mins).
  - **Yellow:** 30 minutes until free time expires (Triggers auto-warning to broker).
  - **Red:** Active Billable Detention running (e.g., +$75/hr accruing live on screen).
- **Financial Exposure Counter:** Shows total unbilled detention dollars sitting on docks right now across the entire fleet, giving dispatchers instant leverage during mid-day broker calls.

6. Dispute Resolution & Analytics Engine

Small fleets often don't know which brokers actually pay detention and which ones drag out disputes until the carrier gives up.

- **Broker Detention Scorecard:** Tracks metrics across your fleet's history with specific brokers:
  - *Average Time to Issue Revised Rate Con*
  - *Claim Approval Rate (% paid vs. denied)*
  - *Total Uncollected Detention Dollars*
- **Historical Evidence Vault:** If a broker repeatedly denies claims claiming "driver arrived late," the app allows the carrier to generate a history report showing all past clean deliveries to that broker, strengthening negotiation power or supporting factoring agency collections.

Summary of Value

Feature	Problem Solved	Immediate Benefit
Broker Rules Engine	Denied claims due to small broker-specific fine print.	Prevents submission errors before they happen.
OCR BOL Scanner	Discrepancies between physical paperwork and ELD times.	Align physical & digital proof instantly on-dock.
Interactive Broker Link	Lost emails and delayed Revised Rate Cons.	Shortens approval time from days/weeks to hours.
Live Exposure Dashboard	Dispatchers missing the 90-minute warning window.	Maximizes billable detention collection rate.
